No Yeast

Foliar biofertilizer
Cosmetic line
Vegetable

Characteristics

The production and development of seedlings require significant contributions salts and metalloids involved in the development of new structures.

No Yeast, is an effective foliar fertilizer that gives out the metallic cofactor (Zn), in association with sodium and chlorine ions. This formulation allows harmonious development of the seedlings by stimulating the internal mechanisms of ARS (Acquired Resistance System). These signals release the plant's anchor from both pathogen (Geotrychum, Candida, etc.) and beneficial (Saccharomyces gender) yeasts.

No Yeast, belongs to a line of advanced foliar fertilizers created by Avance Biotechnologies, Chile S.A., capable of functional interactions with plant and fruit conflictive elements that produce a yeast repellent cosmetic effect.

Based on proteins, the product is 100% organic in its formulation. This guarantees an innocuous product with no pre-harvest intervals and no restrictions.
